Evaluasi Metode *Hierarchical Clustering* Berbasis *Linkage* pada MWMOTE : Studi Kasus Data Akademik Universitas XYZ dan Data UCI

Nama : Meida Cahyo Untoro
NRP : 05111650010059
Pembimbing : Prof. Dr. Ir. Joko Lianto Buliali, M.Sc.

ABSTRAK

Ketidakseimbangan (*Imbalanced*) data terjadi pada berbagai macam data termasuk data akademik Universitas XYZ dan data UCI. Kasus tersebut menyebabkan adanya *misclassified* dikarenakan data mayoritas dominan terhadap data minoritas yang berakibat pada menurunnya nilai akurasi. Metode MWMOTE dapat menjadi pilihan dalam menyelesaikan kasus *imbalanced* melalui pembobotan dan *clustering*.

Penelitian ini bertujuan menangani permasalahan *imbalanced* dataset akademik di Universitas XYZ angkatan 2014 dan 2015 dan data UCI dengan mengevaluasi *hierarchical clustering*. Tujuan tersebut dicapai dengan mengevaluasi tiga metoda *hierarchical cluster* sebagai salah satu sub proses pada MWMOTE untuk menghasilkan data sintetik yang lebih representatif.

Hasil yang didapat dari penelitian ini adalah ketiga metoda AHC tersebut tidak memberikan perbedaan yang signifikan dalam perbaikan akurasi MWMOTE pada data akademik dan 7 data UCI yang diuji dengan *one-way ANOVA* dengan nilai $\text{sig}/\alpha > 0.05$.

ABSTRACT

Imbalanced data occurs in a variety of data including academic data of XYZ University and UCI data. The case is misclassified due to the dominant majority of data on minority data resulting in a decrease in accuracy. The MWMOTE method can be an option in solving imbalanced cases through weighting and clustering. This study aims to address the academic incremental dataset issues at XYZ University force 2014 and 2015 and UCI data by evaluating hierarchical clustering.

This objective was achieved by evaluating three hierarchical cluster methods as one of the sub processes on MWMOTE to produce more representative synthetic data.

The results obtained from this study are the three AHC methods do not give significant difference in MWMOTE accuracy improvement on academic data and 7 UCI data tested with one-way ANOVA with sig / alpha value > 0.05 .

Keyword : Imbalanced, Hierarchical Clustering, Linkage, MWMOTE, Data Synthetic.

KATA PENGANTAR

Puji syukur atas kehadiran Allah SWT, karena atas limpahan dan karunia-Nya lah penulis dapat menyelesaikan buku tesis penelitian ini dengan baik dan lancar. Terima kasih juga tidak lupa penulis ucapkan kepada seluruh pihak yang telah membantu penulis dalam penyusunan buku tesis ini, tanpa bantuan dari seluruh pihak yang telah berkontribusi dalam penyusunan buku tesis ini mungkin buku ini tidak akan selesai.

Pada kesempatan ini, penulis menyampaikan ucapan terima kasih yang sebesar-besarnya kepada:

1. Allah SWT atas limpahan rahmat, karunia, serta ilmu-Nya sehingga penulis dapat menyelesaikan tesis ini dengan baik.
2. Kedua orang tua penulis yang selalu memberi dukungan moril, materil, dan selalu mendoakan penulis untuk bisa menyelesaikan studi.
3. Bapak Prof. Dr. Ir. Joko Lianto Buliali, M.Sc. selaku dosen pembimbing penulis yang telah mempercayai saya menjadi anak bimbing beliau, memberikan bantuan dan motivasi pada penulis sehingga dapat menyelesaikan buku tesis ini.
4. Ibu Dr. Eng. Nanik Suciati, S.Kom., M.Kom., Ibu Dr.Eng. Chastine Fatichah S.Kom. M.Kom., dan Bapak Dr.Eng. Radityo Anggoro, S.Kom., M.Sc. selaku dosen penguji yang telah memberi saran, masukan, dan koreksi dalam tesis ini.
5. Ibu Mastuti Widianingsih, S.Si.,M.Sc. selaku pembimbing tidak tertulis dan partner hidup, yang memberikan segala kemampuan dan waktu sehingga penulis dapat menyelesaikan tesis ini.
6. Bapak Endyk Noviyantono, Bapak Mudjahidin, Bapak Mohammad Yazdi Pusadan, Bapak Tora Fahrudin, Ibu Eviana Tjatur Putri, Ibu Anggreni, Ibu Myrna Ermawati, Ibu Eva Firdayanti Bisono, Bapak Achmad Saiful, dan Bapak Reza Prasetya Prayogo sebagai keluarga ABJ yang banyak sekali memberikan kritik dan saran selama pengerjaan tesis.
7. Rekan-rekan seangkatan 2016 S2 Informatika ITS yang telah menemani penulis selama 2 tahun dalam menempuh studi magister.
8. Serta pihak-pihak lain yang tidak dapat disebutkan satu persatu.

Penulis menyadari bahwa tesis ini masih jauh dari kesempurnaan dan banyak kekurangan. Untuk itu dengan segala kerendahan hati penulis mengharapkan kritik dan saran yang membangun dari pembaca.

Surabaya, 26 Juli 2018

BAB 1

PENDAHULUAN

1.1 Latar Belakang

Universitas XYZ memiliki data akademik yang terus bertambah setiap tahun. Data akademik terdiri dari data presensi, data nilai (Tugas, Quis, UTS, ataupun UAS), dan data aktivitas lainnya yang diakumulasi setiap bulan dalam 1 semester. Akumulasi data tersebut dapat menjadi tolak ukur keberhasilan proses akademik seorang mahasiswa maupun institusi. Seringkali terjadi ketidakseimbangan data, misalnya jumlah mahasiswa lulus tahun pertama secara normal lebih banyak dari pada tidak lulus. Dalam sistem komputasi, ketidakseimbangan data disebut dengan *imbalanced* (Chawla *et al.*, 2002; Barua *et al.*, 2014; Fahrudin *et al.*, 2016). Salah satu permasalahan yang terjadi dalam kasus mahasiswa tidak lulus, karena setiap mahasiswa memiliki tahapan dalam pembelajaran.

Pada penelitian ini data akademik didapat dari penelitian “Deteksi Dini Kegagalan Akademik Serta Multilabelisasi Permasalahan Mahasiswa Dari Data Media Sosial” (Fahrudin, 2017). Data akademik yang didapat bersifat *imbalanced*, dimana mahasiswa lulus tahun pertama secara normal lebih banyak dari pada tidak lulus. Adanya permasalahan data *imbalanced* antara mahasiswa yang tidak dapat melewati evaluasi tahap pertama dalam waktu normal (1 tahun) (data minoritas). Mahasiswa mampu melewati tahap pertama (data mayoritas), menyebabkan akurasi data minoritas menjadi rendah (Jayasree and Gavya, 2015). Pendistribusian yang tidak seimbang (*class imbalanced*) menimbulkan kejadian klasifikasi yang lebih condong ke jumlah data mayoritas (*negative*) dibandingkan dengan jumlah data minoritas (*positive*) (Sáez *et al.*, 2016).

Mellor *et al.* (2015) menyatakan kasus *misclassified* diakibatkan oleh *imbalanced* dataset. Kasus *imbalanced* dapat mengelompokkan data menjadi 2, yaitu data minoritas dan mayoritas (Seiffert, Khoshgoftaar and Van Hulse, 2009; Liu W, Chawla, 2010; Barua *et al.*, 2014). Selain itu, *imbalanced* dapat menyebabkan pembuatan model yang buruk (Gong and Kim, 2017) serta *overfitting* dan penurunan akurasi klasifikasi (Fakhruzi, 2018). Berdasarkan

permasalahan tersebut diperlukan penanganan *imbalanced* dataset, sehingga didapat model yang memiliki ketepatan prediksi yang maksimal pada semua kelas data (Rivera, 2017; Piri, Delen and Liu, 2018). Kasus *imbalanced* dapat ditangani dengan metode *oversampling* (Chawla *et al.*, 2002; Barua *et al.*, 2014; Piri *et al.*, 2018) dan *undersampling* (Ng *et al.*, 2015; Purwar and Singh, 2015; John and Jayasudha, 2017). *Oversampling* dilakukan dengan membuat replika (*resample*) data minoritas, sedangkan *undersampling*, mengurangi data mayoritas sehingga didapatkan data mayoritas dan minoritas seimbang (Barua *et al.*, 2014; Ng *et al.*, 2015; Fahrudin *et al.*, 2016; John and Jayasudha, 2017; Fakhruzi, 2018).

Metode *oversampling* berlebihan dapat menyebabkan *overfitting* dan *undersampling* berlebihan dapat berpengaruh pada hilangnya beberapa informasi penting yang terdapat pada dataset (Seiffert *et al.*, 2009; Napierała, 2012; Ma and Fan, 2017). *Synthetic Minority Oversampling Technique* (SMOTE) dapat menangani *overfitting* data sintetik melalui pendekatan k NN (Chawla *et al.*, 2002; El-Sayed *et al.*, 2016) dengan penggunaan variabel (Blagus *et al.*, 2013). Barua *et al.*, 2014 mengusulkan *Majority Weighted Minority Oversampling Technique* (MWMOTE) sebagai metode perbaikan dari SMOTE melalui pembuatan data sintetik dengan pembobotan dan *clustering* data minoritas. Hasil usulan tersebut ternyata mampu menurun derajat bias atau *noise* serta menghasilkan data sintetik dengan tingkat akurasi lebih baik dari proses *clustering*.

Peningkatan akurasi *classifier* pada data *imabalance* dapat ditangani dengan menggunakan *agglomerative hierarchy clustering* (AHC). AHC memiliki kinerja yang akurat bahkan ketika *cluster* memiliki rasio *imbalanced* rendah pada data minoritas serta terjadi tumpang tindih data mayoritas dengan cara partisi dan deteksi *outlier* (Beyan and Fisher, 2015). Li, Wang and Hao, 2009 melakukan penelitian terkait *comparison of Cluster Ensembles* pada *average*, *complete*, dan *single linkage* didapat peningkatan performa akurasi 10 dataset UCI. AHC pada pengenalan wajah berbasis (*Content Based Image Retrieval*) CBIR dapat meningkatkan performa komputasi dan dilakukan uji validitas *cluster* (*cophenetic correlation coefficient / CCC*) (Fachrurrozi *et al.*, 2017). Hasil analisis *cluster* AHC berdasarkan dendrogram memberikan hasil yang berbeda-beda setiap dataset uji coba (Hakim, Subanar and Winarko, 2010).

Data sintetik penting dalam pembuatan pola data minoritas. Permasalahan muncul ketika data yang tidak seimbang menyebabkan kelompok tertentu menjadi *misclassified*. Penelitian ini bertujuan untuk menangani permasalahan data tidak seimbang (*imbalanced*) dengan membuat data sintetik menggunakan MWMOTE dan mengevaluasi metode *cluster* berbasis *linkage*. Pengukuran performa pada model yang dihasilkan berdasarkan pada nilai *cophenetic correlation coefficient*, *F-measure*, *recall*, *precision*, dan *accuracy*.

1.2 Perumusan Masalah

Rumusan masalah yang diangkat dalam penelitian ini adalah sebagai berikut.

1. Bagaimana cara menangani *imbalanced* dataset akademik dan dataset UCI kelas minoritas dengan metode MWMOTE.
2. Bagaimana cara mengevaluasi metode *hierarchical clustering* berbasis *linkage* pada MWMOTE.

1.3 Tujuan Penelitian

Tujuan yang akan dicapai dalam penelitian ini adalah

1. Menangani permasalahan *imbalanced* data akademik Universitas XYZ angkatan 2014 dan 2015 dan dataset UCI.
2. Menganalisis penggunaan metode *hierarchical clustering* pada algoritma MWMOTE dalam perbaikan kualitas *cluster* dan akurasi.

1.4 Manfaat Penelitian

Manfaat dari penelitian ini adalah memberikan solusi penanganan data *imbalanced* pada data akademik Universitas XYZ dan dataset UCI dengan pengujian *hierarchical clustering* metode *cluster* pada algoritma MWMOTE.

1.5 Kontribusi Penelitian

Kontribusi dalam penelitian ini adalah mengevaluasi metode *Hierarchical Clustering* pada proses *cluster* MWMOTE pada kualitas *cluster* dan perbaikan akurasi klasifikasi pada data akademik Universitas XYZ angkatan 2014 dan 2015 dan data UCI.

1.6 Batasan Penelitian

Penelitian ini dibatasi pada hal-hal sebagai berikut:

1. Data yang digunakan merupakan data akademik Universitas XYZ selama 1 semester angkatan 2014 dan 2015 (Bulan Agustus – Desember).
2. Data UCI yang digunakan sebanyak 10 dataset, antara lain : Abalone, Breast, Ecoli, Glass, Libra, OCR, Robot, Satimage, Wine dan Yeast.
3. *Cluster* yang digunakan *average*, *complete*, dan *single linkage* dan dievaluasi dengan *cophenetic correlation coefficient*.
4. *Classifier decision tree* (J48) digunakan untuk mengevaluasi metode *oversampling* dengan nilai parameter *precision*, *recall*, *F-measure* dan *accuracy*.

BAB 2

KAJIAN PUSTAKA

2.1 Data Mining

Data mining sering juga disebut sebagai *knowledge discovery in database* (KDD) yaitu proses ekstraksi dan analisis sejumlah data. Proses tersebut bertujuan untuk *summarization* (generalisasi data), klasifikasi, *clustering*, *association*, dan prediksi sebagai basis pengetahuan untuk keperluan pengambilan keputusan. Data mining memiliki beberapa tahapan, data *cleaning*, data *integration*, data *selection*, data *transformation*, *pattern evaluation*, dan *knowledge presentation* (Ristoski and Paulheim, 2016).

Pengenalan pola diperlukan dalam mempelajari klasifikasi data berdasarkan kelas atau kategori dan mengetahui label data. Data yang digunakan bisa berupa gambar, *signal*, subjek manusia (misalnya pasien, mahasiswa), ataupun pengukuran lain yang perlu klasifikasi (Fahrudin *et al.*, 2017). *Machine learning* menjadi salah satu metode analisis dalam data mining. Hasil analisis metode tersebut dapat berupa deskripsi, prediksi, klasifikasi, *clustering*, dan asosiasi (Larose and Larose, 2014).

2.2 Imbalanced

Imbalanced adalah ketidakseimbangan data sehingga didapatkan kelas mayoritas dan kelas minoritas (Guo *et al.*, 2016). Ketidakseimbangan dataset menjadi permasalahan yang dihadapi oleh para peneliti dalam domain *imbalanced*. Kompleksitas data yang diperoleh para peneliti memiliki 3 sifat, yaitu *overlap*, *small disjunct* dan *outlier* (**Gambar 2.1**) (Mahmood, 2015).

Klasifikasi *imbalanced* menyebabkan *misclassification* sehingga nilai akurasi yang dihasilkan cenderung buruk serta memungkinkan kelas minoritas dianggap sebagai *outlier* (Seiffert *et al.*, 2009). *Imbalanced* umumnya dapat ditangani dengan 3 cara, yaitu *Random Under-Sampling* (RUS), *Random Over-Sampling* (ROS), dan *Hybrid Sampling Methods* (HSM) (Mahmood, 2015).

Gambar 2.1 *Overlap (I), Small disjunct (II), Outlier (III)*

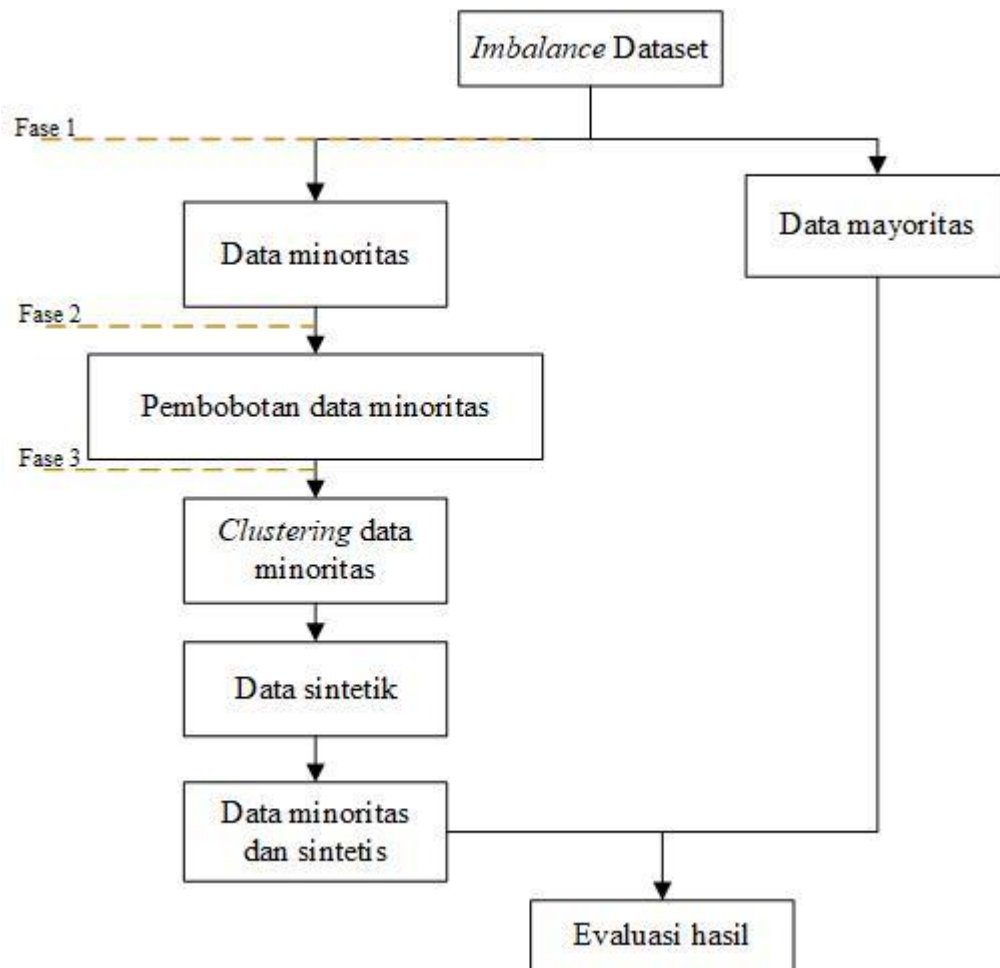

Random Under-Sampling (RUS) berguna menghitung selisih antara kelas mayoritas dan minoritas (sebagai langkah pertama) kemudian dilakukan perulangan selisih hasil perhitungan. Cara RUS lebih efektif dan cepat dalam proses prediksi *imbalanced class*, misalnya pada kasus *software defects* (Irawan *et al.*, 2015). *Random Over-Sampling* (ROS), menyeimbangkan distribusi kelas minoritas dan kelas mayoritas. Dalam kasus ini, dilakukan replikasi acak kelas minoritas sampai didapatkan jumlah kelas minoritas sama dengan kelas mayoritas. Penelitian menunjukkan penggunaan ROS dapat mengurangi terjadinya *overfitting* (Zheng, Cai and Li, 2015). *Hybrid Sampling Methods* (HSM) merupakan penggabungan metode RUS dan ROS (Seiffert *et al.*, 2009). Kelas minoritas pada umumnya menjadi acuan prediksi yang bersifat negatif (*noise*), sehingga mampu menurunkan kinerja model kelas mayoritas (Napierała, 2012).

2.3 *Oversampling*

Oversampling menjadi salah satu cara dalam menangani *imbalanced* dataset dengan cara pembuatan data sintetik kelas minoritas sesuai jumlah selisih kelas mayoritas dan minoritas. Pembuatan data sintetik dapat dilakukan dengan metode *Synthetic Minority Oversampling Technique* (SMOTE). Pembuatan data sintetik kelas minoritas bertujuan menyeimbangkan rasio antar kelas minoritas dengan mayoritas. Data tersebut dibuat berdasarkan kelas minoritas dengan prinsip *K-Nearest Neighbor* (Chawla *et al.*, 2002).

Prinsip *K-Nearest Neighbor* digunakan untuk mencari nilai terdekat kelas minoritas pada *Majority Weighted Minority Oversampling Technique* (MWMOTE). Pembuatan data sintetik pada MWMOTE terdapat 3 tahap, yaitu

identifikasi sampel kelas minoritas dan kelas mayoritas pada dataset, pembobotan kelas minoritas, dan *clustering* (Barua *et al.*, 2014) (**Gambar 2.2**).

Gambar 2.2 Algoritma MWMOTE (Barua *et al.*, 2014)

Pembuatan data sintetik MWMOTE memiliki cara kerja dengan memilih sampel dengan memisahkan data kelas mayoritas dan kelas minoritas. Tahap selanjutnya dilakukan proses pembobotan untuk mengetahui data kelas minoritas yang mendekati *borderline*. Pembobotan diberikan berdasarkan kedekatan data dengan *borderline*, jumlah anggota *cluster* kecil, dan *cluster* kelas minoritas (berjumlah banyak) yang berada dalam kelas mayoritas. *Clustering* menjadi proses lanjutan tahap pembobotan yang dilakukan dengan *alglomerative hiearacal clustering* sehingga didapatkan data sintetik (Barua *et al.*, 2014).

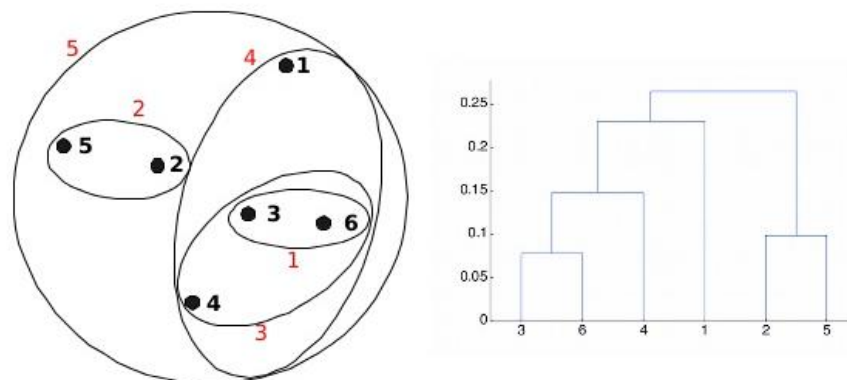

2.4 Analisis Cluster

Analisis *cluster* merupakan teknik analisis statistik yang ditujukan untuk menempatkan sekumpulan data ke dalam dua atau lebih *cluster* berdasarkan kemiripan data berdasarkan variasi atribut (Köhn and Hubert, 2015). Secara umum metode *clustering* ada dua, yaitu *hierarchical clustering* dan *non-hierarchical clustering*.

Hierarchical clustering dilakukan melalui proses pengelompokan *clustering* yang berasal dari *cluster* individu yang memiliki kemiripan. Ada 2 macam *hierarchical clustering* yaitu *agglomerative* dan *devisive clustering*. Hasil akhir *agglomerative clustering* akan didapatkan satu *cluster* utuh yang berisi semua data, sedangkan pada *devisive clustering* menggunakan prinsip *top bottom* (1 *cluster* dipisahkan dalam 2 ataupun 3 *cluster* yang berbeda) (Köhn and Hubert, 2015). *Hierarchical agglomerative* terdiri dari *linkage*, *Ward's*, dan *centroid method* (Lin et al., 2017). *Linkage method* terdiri dari 3 bagian, yaitu :

2.4.1 Average linkage

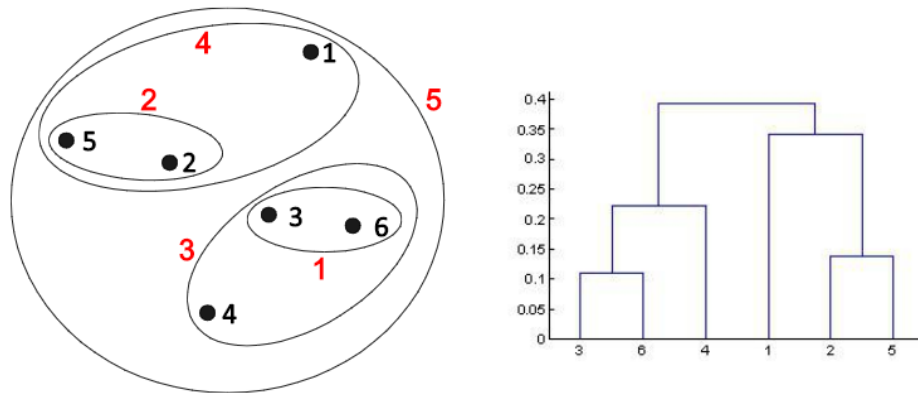

Jarak antara dua *cluster* didefinisikan sebagai jarak rata-rata antara setiap titik dalam satu *cluster* ke setiap titik pada *cluster* lain. Prosedur *average linkage* dengan mendefinisikan matrik D untuk memperoleh data paling dekat, sebagai contoh **Gambar 2.3**. Data U dan V digabungkan ke dalam bentuk *cluster* (UV) (Huth, Nemesova and Klimperova, 1993), sehingga didapatkan jarak rata-rata antara UV ataupun jarak antar *cluster* yang lainnya.

Gambar 2.3 Average linkage

2.4.2 Complete linkage

Complete linkage merupakan jarak maksimum antar dua *cluster* (**Gambar 2.4**). Prinsip jarak yang digunakan adalah jarak terjauh antar data (Pusadan, M Y, Buliali, J L, Ginardi, 2016).

Gambar 2.4 Complete linkage.

$Dist(u[i]$ dan $dist(v[j]$ masing-masing adalah jarak antara anggota yang paling jauh dari cluster U dan V serta cluster I dan K (Abd Rahman, Abu Bakar and Zulkefli, 2016).

2.4.3 Single linkage

Metode ini menggunakan prinsip jarak minimum antar dua data terdekat yang akan membentuk *cluster* pertama (**Gambar 2.5**). Langkah selanjutnya memiliki 2 kemungkinan, data ketiga akan bergabung dengan *cluster* yang telah terbentuk atau data ketiga akan bergabung dengan data yang lain untuk membentuk *cluster* baru (Almeida *et al.*, 2007).

Gambar 2.5 Single linkage

2.5 *Cophenetic Correlation Coefficient*

Pengujian hasil *clustering* dilakukan dengan validitas *cluster*. Uji validitas *cluster* diperlukan untuk menentukan kualitas hasil analisis *cluster*. Salah satu ukuran yang dapat digunakan untuk menguji validitas hasil *cluster* metode hirarki adalah dengan *cophenetic correlation coefficient* (CCC). *Cophenetic Correlation Coefficient* merupakan nilai korelasi antara jarak *euclidean* dan *dendrogram* (*cophenetic matrix*) (Kumar and Toshniwal, 2016). Nilai CCC dikatakan baik apabila nilai *cluster* mendekati 1 dan buruk jika mendekati nilai negatif 1 (Bouguettaya *et al.*, 2015, Kumar and Toshniwal, 2016).

2.6 *Klasifikasi Decision Tree*

Klasifikasi adalah proses untuk menemukan model atau fungsi yang menjelaskan atau membedakan konsep atau kelas data dengan tujuan memperkirakan kelas yang tidak diketahui dari suatu data. Klasifikasi data melibatkan dua proses, yaitu proses *training* dan *testing*. Proses *training* digunakan dalam pembuatan model atau pola, sedangkan proses *testing* digunakan untuk mengetahui keakuratan model hasil *training* (Fahrudin, Buliali and Fatichah, 2017). *Decision tree* adalah algoritma yang paling banyak digunakan untuk masalah klasifikasi. *Decision tree* terdiri dari beberapa simpul yaitu *tree's root*, *internal node* dan *leafs*. Konsep entropi digunakan untuk penentuan pada atribut mana sebuah pohon akan terbagi (*split*) (Lesmana, 2012). *Decision tree* dikatakan baik jika mendekati nilai model yang terbentuk dan diukur nilai *presicion*, *recall*, *F-measure*, dan *accuracy* (Fahrudin, Buliali and Fatichah, 2017).

2.7 *Uji Statistik*

Uji statistik digunakan untuk menguji perbedaan antar grup, kelompok dan jenis perlakuan pada sebuah penelitian. Uji statistik ada dua macam parametrik dapat menggunakan *Analysis of Variance* (ANOVA) dan Friedman merupakan non parametrik. ANOVA digunakan untuk menganalisis perbedaan rata-rata antara kelompok dan prosedur terkait (seperti “variasi” antara kelompok) (Gregory, 2009) (Tabel 2.1). Tabel 2.2 adalah gambaran hasil dari uji statistik

menggunakan ANOVA. Dimana banyaknya grup, kelompok, dan perlakuan dinyatakan dalam “k”, “n” adalah jumlah data dari grup, kelompok dan perlakuan

$$\sum_{i=1}^k n_i.$$

Tabel 2.1 Tabel ANOVA

Tabel 2.2 Hasil Evaluasi *One Way* ANOVA

| | <i>Sum of Squares</i> | Df | <i>Mean Square</i> | F | Sig. |
|-----------------------|-----------------------|----|--------------------|--------|------|
| <i>Between Groups</i> | 490.433 | 2 | 245.217 | 91.866 | .000 |
| <i>Within Groups</i> | 152.150 | 57 | 2.669 | | |
| Total | 642.583 | 59 | | | |

ANOVA dibagi menjadi beberapa bagian salah satunya *One Way* ANOVA, *two-way* ANOVA. *One Way* ANOVA bertujuan untuk membandingkan lebih dari dua rata-rata, sedangkan gunanya untuk menguji kemampuan generalisasi. Maksudnya dari signifikansi hasil penelitian, jika terbukti berbeda berarti kedua sampel tersebut dapat digeneralisasikan (data sampel dianggap dapat mewakili populasi). Prosedur dalam *One Way* ANOVA harus berdistribusi normal dan bervarian *homogeny*. Serta pembuatan hipotesis yang menyatakan tidak adanya hubungan antara variabel independen (X) dan variabel dependen (Y) disebut H0. H1 adalah hipotesis yang menyatakan adanya hubungan antara variabel independen (X) dan variabel dependen (Y) yang diteliti. Tujuan dari hipotesis berfungsi memusatkan peneliti pada focus permasalahan yang diselesaikan.

Jika H0 diterima berarti semua perlakuan yang dicobakan memberikan pengaruh yang sama, tetapi jika H1 yang diterima berarti paling sedikit terdapat sepasang nilai tengah perlakuan yang berbeda. Untuk mengetahui pasangan perlakuan mana yang mempunyai nilai tengah yang berbeda tersebut, maka perlu dilakukan pengujian lanjutan untuk mengetahui perbedaan diantara nilai tengah perlakuan tersebut. Pengujian tersebut diistilahkan dengan uji lanjutan atau biasa juga disebut uji pembandingan berganda.

Penggunaan uji lanjutan digunakan untuk mengetahui pasangan perlakuan mana yang mempunyai nilai tengah yang berbeda. Untuk menentukan jenis uji lanjutan yang sesuai maka harus diperhatikan apakah uji yang akan digunakan adalah untuk perbandingan yang bersifat terencana atau tidak. Perbandingan terencana adalah perbandingan yang memang direncanakan sebelum data suatu percobaan diperoleh atau sebelum percobaan dilakukan, sedangkan perbandingan tidak terencana adalah perbandingan yang dilakukan setelah data diperoleh.

Uji Duncan adalah prosedur perbandingan dari nilai tengah perlakuan (rata-rata perlakuan) untuk semua pasangan perlakuan yang ada. Uji lanjut ini menggunakan nilai pembanding sebagai alat uji sesuai dengan jumlah nilai tengah atau rata-rata yang ada di wilayah dua perlakuan yang dibandingkan. Uji Duncan juga digunakan untuk melihat adanya pengaruh antar perlakuan yang diuji Duncan atau juga dikenal dengan istilah *Duncan Multiple Range Test* (DMRT) memiliki nilai kritis yang tidak tunggal tetapi mengikuti urutan rata-rata yang dibandingkan (**Tabel 2.3**). Nilai kritis uji Duncan dinyatakan dalam nilai *least significant range*.

BAB 3

METODOLOGI PENELITIAN

Bab 3 berisi pemaparan proses penelitian yang diawali dengan studi literatur (Gambar 3.1).

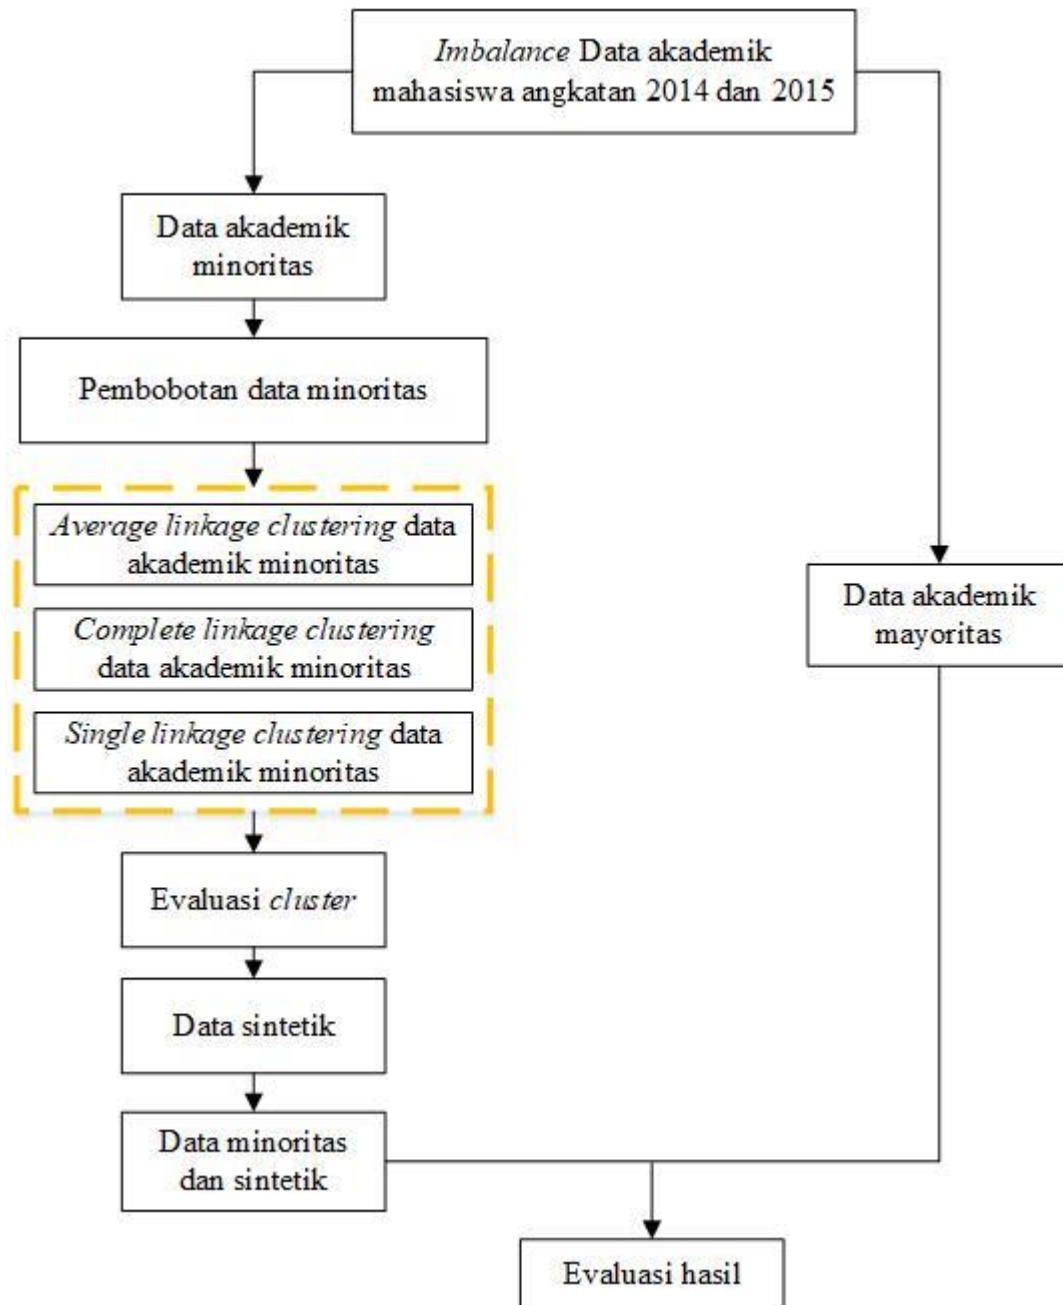

Gambar 3.1 Diagram Blok Metode Penelitian

3.1 Studi Literatur

Penelitian diawali dengan proses pengkajian yang berkaitan dengan topik penelitian. Pada penelitian ini, referensi yang digunakan diperoleh dari jurnal yang memiliki hubungan dengan data akademik, data *mining*, *imbalanced* dataset, *Agglomerative Hierarchical Clustering* (AHC), *oversampling*, *undersampling*, dan *Majority Weighted Minority Over-sampling Technique* (MWMOTE).

3.2 Perancangan

Penelitian dilakukan dengan menggunakan data akademik mahasiswa angkatan 2014 dan 2015 dalam 1 semester. Metode yang digunakan adalah *Majority Weighted Minority Over-sampling Technique* (MWMOTE) dengan mekanisme *synthetic oversampling technique* (Chawla *et al.*, 2002, Barua *et al.*, 2014, Jayasree and Gavya, 2015, Fahrudin, Buliali and Fatichah, 2016, Ma and Fan, 2017, Piri, Delen and Liu, 2018). Perancangan penelitian tersaji pada **Gambar 3.2**.

Gambar 3.2 Blok Diagram Penelitian

Data akademik akan dibagi menjadi data *training* dan *testing*. Data *training* diproses guna membentuk pola untuk validasi data *testing*. Data *training* diproses dengan metode *oversampling* MWMOTE untuk memisahkan kelas mayoritas dan minoritas (Sivaranjani, 2016). *Clustering* dilakukan dengan menggunakan *agglomerative hierarchical clustering* (AHC) *average*, *complete*, dan *single linkage*. Hasil *clustering* akan membentuk data sintetik dari *oversampling* yang berada dalam satu *cluster* (Barua *et al.*, 2014). Gabungan data

minoritas hasil *clustering* (data sintetik) dan data minoritas akan memiliki rasio yang sama dengan data mayoritas. *Cophenetic correlation coefficient* merupakan metode yang digunakan dalam evaluasi AHC untuk mengetahui kinerja hasil *cluster*, sedangkan kinerja *oversampling* MWMOTE dievaluasi dengan klasifikasi menggunakan *disccion tree* (J48) berdasarkan nilai *precision*, *recall*, *F-measure* dan *accuracy*.

3.2.1 Dataset

Dataset yang digunakan merupakan data akademik mahasiswa Universitas XYZ angkatan 2014 dan 2015. **Gambar 3.3** menjelaskan usulan data akademik yang digunakan dalam rancangan pemodelan deteksi periodik dengan atribut yang berbeda untuk setiap data.

Gambar 3.3 Skenario akumulasi data akademik Universitas XYZ Angkatan 2014 dan 2015

Tabel 3.1 Merupakan ilustrasi dataset yang akan digunakan dalam penelitian. Dataset akademik terdiri dari bulan Agustus, September, Oktober, November dan Desember, dimana data dijadikan data *training* dan *testing*. Model predeksi penanganan *imbalanced* menggunakan dataset setiap bulan untuk mengetahui performa dan kinerja metode *cluster* yang diusulkan pada algoritma MWMOTE. Agar data dapat diolah didalam penanganan *imbalanced*, maka perlu dilakukan beberapa preproses terhadap data mentah akademik. Data di proses dikarenakan bersumber dari 7 fakultas dan 24 program studi, sehingga terdapat perbedaan matakuliah dan aktivitas penunjang. Rata yang mempresentasikan keseluruhan data akademik

Tabel 3.1 Contoh Dataset Akademik Universitas XYZ Angkatan 2014 dan 2015

| ID Mahasiswa | Absensi | Aktivitas Internet | Aktivitas Blog | Aktivitas Lomba & Panitia | Nilai UTS | Nilai Akhir | Label | Simbol |
|--------------|---------|--------------------|----------------|---------------------------|-----------|-------------|-------------|--------|
| 1 | 94.41 | 0.08 | 0 | 0 | 100 | 100 | Lulus | 1 |
| 2 | 11.48 | 0.18 | 0 | 0 | 77.70 | 61.11 | Tidak Lulus | 0 |
| 3 | 97.9 | 0.36 | 0 | 0 | 100 | 100 | Lulus | 1 |
| ... | ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... | ... |

3.2.2 *Pra-proses data imbalanced*

Pra-proses data *imbalanced* bertujuan mempersiapkan data akademik untuk diproses. Proses tersebut terdiri dari pemisahan data mayoritas dan data minoritas berdasarkan label kelas dataset (**Tabel 3.1**). Pra-proses kelas mayoritas berlabel lulus disimbolkan dengan angka satu (1), sedangkan angka nol (0) menunjukkan simbol kelas minoritas berlabel tidak lulus.

3.2.3 *Oversampling MWMOTE*

Oversampling MWMOTE melibatkan 3 fase, yaitu (Barua *et al.*, 2014):

Fase 1 Pemilihan sampel kelas minoritas.

1. S-min = Sampel data minoritas, S-maj = Sampel data mayoritas.
2. S-minf = Sampel data minoritas yang berada pada kelas mayoritas.

$$S_{minf} = S_{min} - \{x_i \in S_{min} : N N(x_i)\} \quad (3.1)$$

3. S-bmaj untuk menentukan *borderline* (batas) kelas mayor.

$$S_{bmaj} = \cup_{x_i \in S_{minf}} N_{maj}(x_i) \quad (3.2)$$

4. S-imin = Sampel data kelas minoritas informatif.

$$N_{min}(y_i) \cap S_{imin} = \cup_{y_i \in S_{bmaj}} N_{min}(y_i) \quad (3.3)$$

Fase 2 Pembobotan sampel kelas minoritas.

1. I-w = Pembobotan sampel data S-imin
2. S-w = Penyeleksian sampel data I-w sebagai dasar pembuatan data sintetik

$$S_w(x_i) = \sum_{y_i \in S_{bmaj}} I_w(y_i x_i) \quad (3.4)$$

3. S-p = Probabilitas sampel data S-w.

$$S_p(x_i) = \frac{S_w(x_i)}{\sum_{z_i \in S_{imin}} S_w(z_i)} \quad (3.5)$$

Fase 3 Pembuatan data sintetik sampel kelas minoritas menggunakan metode *clustering*

Pada penelitian ini, fase 3 digunakan untuk mengevaluasi *hierarchical clustering* guna memperoleh data sintetik yang lebih representatife pada sampel kelas minoritas.

1. Pilih data minoritas “x” dari S_{imin} sesuai dengan distribusi probabilitas $\{S_p(x_i)\}$, notasi “x” adalah anggota dari *cluster* C_k , $1 \leq k \leq M$
2. Pilih data minoritas “y” secara random dari anggota *cluster* C_k

3.3 Skenario Uji Coba dan Pengujian

Pengujian berfungsi menangani *imbalanced* dataset akademik (**Tabel 3.1**) dan mengevaluasi *hierarchical clustering* pada MWMOTE.

1. *Imbalanced* dataset akademik ditangani dengan pembentukan data sintetik berdasarkan sampel kelas minoritas yang diproses dengan metode MWMOTE.
2. Pada AHC, seluruh sampel kelas minoritas merupakan *cluster* awal. *Cluster* awal tersebut nantinya akan diproses secara hiraki sampai terbentuk *cluster* tunggal.
3. *Clustering* yang digunakan AHC berupa *average*, *complete*, dan *single linkage*. Contoh proses *clustering* dengan AHC adalah sebagai berikut :
 - a. *Average linkage clustering* sampel data minoritas pada data akademik

$$d_{C_{i,j}} = \frac{1}{|C_i| \times |C_j|} \sum_{i \in C_i, j \in C_j} d_{ij} \quad (3.6)$$

Keterangan :

$C_{i,j}$ = *cluster*

d_{ij} = jarak anggota antar *cluster*

i, j = anggota *cluster*

Pada tahap awal seluruh sampel data minoritas merupakan *cluster* awal. Sampel data minoritas 3 dan 4 memiliki jarak terdekat yaitu 81.2109 sehingga dapat dijadikan dalam satu *cluster* (**Gambar 3.4**). Proses *clustering* dilanjutkan sampai diperoleh *cluster* dengan jumlah tertentu berdasarkan ambang batas minimum setiap anggota *cluster*.

| | 1 | 2 | 3 | 4 | 5 | 6 |
|---|----------|----------|----------|----------|----------|---|
| 1 | 0 | | | | | |
| 2 | 85.2102 | 0 | | | | |
| 3 | 589.5407 | 571.7396 | 0 | | | |
| 4 | 587.9841 | 578.1380 | 81.2109 | 0 | | |
| 5 | 720.6073 | 710.1504 | 157.4909 | 133.0670 | 0 | |
| 6 | 861.8442 | 850.0266 | 293.1995 | 280.8847 | 155.1774 | 0 |

Gambar 3.4 Contoh matrik data minoritas

Berikut merupakan perhitungan *average linkage* data minoritas 3 dan 4.

$$d_{3,4} = \frac{\{d_3 + d_4\}}{2} = \frac{\{81.2109 + 81.2109\}}{2} = 81.2109$$

- b. *Complete linkage clustering* sampel data minoritas (**Gambar 3.4**) berfungsi membentuk *cluster* berbasis jarak terjauh antar sampel data kelas minoritas (**Persamaan 3.7**).

$$d_{C_{i,j}} = \max_{i \in C_i, j \in C_j} d_{ij} \quad (3.7)$$

Berikut perhitungan *complete linkage* jarak terjauh data minoritas 1 dan 6 :

$$d_{1,6} = \max\{d_1, d_6\} = \max\{861.8442, 861.8442\} = 861.8442$$

- c. *Single linkage clustering*, membentuk *cluster* dengan ketentuan jarak terdekat antar sampel data kelas minoritas (**Persamaan 3.8**).

$$d_{C_{i,j}} = \min_{i \in C_i, j \in C_j} d_{ij} \quad (3.8)$$

Data minoritas 3 dan 4 memiliki jarak data kelas minoritas terdekat (**Gambar 3.4**).

$$d_{3,4} = \min\{d_3, d_4\} = \min\{81.2109, 81.2109\} = 81.2109$$

Penggunaan ilustrasi dataset sintetik dengan mengkondisikan keseluruhan data, dimana data minoritas, mayoritas dan sintetik ditentukan dari awal (Tabel 3.2). Data tersebut merupakan dataset yang sudah dikondisikan terlebih dahulu dengan simbol yang telah ditentukan (Gambar 3.5(a)). Data minoritas disimbolkan dengan nol (0), data mayoritas dengan simbol satu (1), dan tanda nol bintang (0*)

untuk data sintetik. Data tersebut berfungsi untuk memvalidasi hasil pembuatan data sintetik dengan algoritma MWMOTE.

Tabel 3.2 Ilustrasi Data Sintetik

| Instance | Data X | Data Y | Label |
|----------|--------|--------|-------|
| 1 | 0.51 | 0.28 | 0 |

| ... | ... | ... | ... |
| ... | ... | ... | ... |

(a)

(b)

(c)

(d)

Gambar 3.5 Data Sintetik (a), Data Sintetik dengan *Average linkage* (b), Data Sintetik dengan *Complete linkage* (c), dan Data Sintetik dengan *Single linkage* (d).

Pembuatan data sintetik untuk average linkage masih berada pada data mayor (**Gambar 3.5(b)** Lingkaran merah). Data sintetik pada complete linkage sama dengan data minoritas dan berada di data mayoritas (**Gambar 3.5(c)** Lingkaran merah). Pada

single linkage data sintetik terbentuk berada di data mayoritas (**Gambar 3.5(d)** Lingkaran merah).

4. *Cophenetic correlation coefficient* (Persamaan 3.4) digunakan untuk pengujian *cluster* yang terbentuk dari data minoritas.

$$CCC = \frac{\sum_{i < j} (d_{ij} - \bar{d}_{ij})(d_{cij} - \bar{d}_{cij})}{\sqrt{[\sum_{i < j} (d_{ij} - \bar{d})^2][\sum_{i < j} (d_{cij} - \bar{d}_{cij})^2]}} \quad (3.9)$$

CCC = *cophenetic correlation coefficient*

d_{ij} = jarak antar anggota i dan j

d_{cij} = jarak dendrogram yang terbentuk antar anggota i dan j

\bar{d}_{ij} = rata-rata d_{ij}

\bar{d}_{cij} = rata-rata d_{cij}

Berikut contoh perhitungan *cophenetic correlation coefficient*.

Tabel 3.3 Contoh data minoritas (Data akademik) Universitas XYZ

| | Cluster | | | | | | | |
|-----------|---------|----------|---------|---------|----------|-----|-----|-----|
| | 1 | 2 | 3 | 4 | 5 | ... | ... | ... |
| D_{ij} | 35.1794 | 48.0495 | 70.8995 | 85.6702 | 100.8263 | ... | ... | ... |
| d_{cij} | 35.1794 | 48.04945 | 63.2249 | 70.8995 | 108.1155 | ... | ... | ... |

$$\bar{d} = \frac{1}{5} (35.1794 + 48.0495 + 70.8995 + 85.6702 + 100.8263) = 68.1250$$

$$\bar{d}_c = \frac{1}{5} (35.1794 + 48.0495 + 63.2249 + 70.8995 + 108.1155) = 65.0938$$

$$CCC = \frac{\sum_{i < j} (100.8263 - 68.1250)(108.115 - 65.0938)}{\sqrt{[\sum_{i < j} (100.8263 - 68.125)^2][\sum_{i < j} (108.1155 - 65.0938)^2]}}$$

$$CCC = \frac{2831.265}{\sqrt{8831086.89}} = \frac{2831.265}{2971.714} = 0.9527$$

Cophenetic memiliki nilai $-1 \leq CCC \leq 1$. Nilai *cophenetic* mendekati 1 maka *cluster* disebut baik dan nilai *cophenetic* mendekati 0 maka *cluster* yang dihasilkan buruk (Bouguettaya *et al.*, 2015). Dari **Tabel 3.3** didapat nilai *cophenetic* 0.9527 menunjukkan bahwa *cluster* yang terbentuk adalah *cluster* optimum.

5. Data sintetik terbentuk dari pembobotan dan *clustering* menggunakan *Agglomerative Hierarchical Clustering* (AHC) kelas minoritas pada MWMOTE. Data sintetik yang terbentuk merupakan selisih antara data mayoritas dengan data minoritas (**Persamaan 3.10**).

$$\begin{aligned}
 & \text{for } s \text{ in } \text{ xrange}(S_{maj} - S_{min}) \\
 & \quad s_i = x_i + \alpha \times (y_i - x_i) \\
 & \text{end}
 \end{aligned} \tag{3.10}$$

Keterangan :

- s = Data sintetik
 x = Sampel data kelas minoritas
 α = Nilai random $0 \leq \alpha \leq 1$
 y = Sampel data kelas minoritas dari *cluster* yang sama dengan x

3.4 Evaluasi Kinerja Metode

Evaluasi kinerja metode yang di usulkan pada data akademik tahun angkatan 2014 dan 2015 menggunakan *confusion matrix* **Tabel 3.4**.

Tabel 3.4 *Confusion Matrix*

| Actual | (+) Predicted | (-) Predicted |
|--------|---------------|---------------|
| (+) | TP | FN |
| (-) | FP | TN |

Kelas (+) ditujukan untuk kelas mahasiswa yang tidak mengalami gagal akademik, yaitu mahasiswa lulus tahun pertama secara normal lebih banyak dari pada tidak lulus. Sedangkan kelas (-) merupakan kelas mahasiswa pada tahun pertama tidak lulus dengan permasalahan perkuliahan. Evaluasi kinerja yang digunakan *precision*, *recall*, *F-Measure*, dan *accuracy* untuk masing-masing kelas. *True positive* (TP) adalah kasus di mana prediksi ya (memiliki penyakit), dan memiliki penyakit. *True negative* (TN) memperkirakan tidak, dan tidak memiliki penyakit. *False positive* (FP) memperkirakan ya, tetapi sebenarnya tidak memiliki penyakit. (Juga dikenal sebagai "Tipe I kesalahan.") *False Negative* (FN) memperkirakan tidak, tetapi benar-benar memiliki penyakit. (Juga dikenal sebagai "Kesalahan Tipe II.")

$$\text{Precision} = \frac{TP}{(TP+FP)} \tag{3.11}$$

$$Recall = \frac{TP}{(TP+TN+FP+FN)} \quad (3.12)$$

$$F - Measure = 2 \times \frac{Precision.Recall}{(Precision+Recall)} \quad (3.13)$$

$$Accuracy = \frac{(TP+TN)}{(TP+TN+FP+FN)} \quad (3.14)$$

Precision adalah tingkat ketepatan antara informasi yang diminta oleh pengguna dengan jawaban yang diberikan oleh sistem. *Recall* adalah tingkat keberhasilan sistem dalam menemukan kembali sebuah informasi. *F-measure* merupakan salah satu perhitungan evaluasi dalam temu kembali informasi yang mengkombinasikan *recall* dan *precision*. *Accuracy* didefinisikan sebagai tingkat kedekatan antara nilai prediksi dengan nilai aktual.

BAB 4

HASIL PENELITIAN DAN PEMBAHASAN

Pada bagian ini dipaparkan hasil penelitian dan pembahasan dari setiap langkah yang telah dipaparkan pada **BAB 3**. Hasil penelitian dievaluasi sesuai dengan skenario pengujian yakni perhitungan *cophenetic correlation coefficient*, *precision*, *recall*, *F-measure*, dan *accuracy*.

4.1 Implementasi

Metode yang diusulkan diimplementasikan menggunakan bahasa pemrograman python 2.7 dan IDE Anaconda Navigator serta Sublime Text 3. Spesifikasi perangkat keras terdiri dari system operasi Windows 10 Enterprise 64-bit, RAM 16 GB, Processor Intel(R) Core(TM) i5 – 7400 CPU 3.00GHz.

4.2 Dataset Pengujian

Uji coba dilakukan pada data akademik angkatan 2014 dan 2015 Universitas XYZ sebanyak 12854 baris data dan 10 dataset UCI (**Tabel 4.1 dan 4.2**). Data tersebut merupakan akumulasi data akademik yang bersifat *imbalanced* pada bulan Agustus, September, Oktober, November, dan Desember. *Oversampling* dilakukan guna menangani *imbalanced* dataset. Pra-proses dilakukan sebelum *oversampling* MWMOTE dengan tujuan pemisahan data menjadi data *trainning* dan data *testing* dengan perbandingan persentase 70% : 30%. Data *trainning* digunakan untuk pembuatan model terhadap data *testing*. Data akademik memiliki dua label yaitu lulus dan tidak lulus, dalam tahap pra-proses label akan dirubah ke dalam angka 1 (lulus) dan 0 (tidak lulus) (**Lampiran 1**).

Tabel 4.1 Deskripsi Data akademik angkatan 2014 dan 2015 Universitas XYZ

| Dataset | Atribut | Jumlah Data | Mayoritas | Minoritas | Persentase Minoritas | <i>Imbalanced ratio</i> |
|-----------|---------|-------------|-----------|-----------|----------------------|-------------------------|
| Agustus | 34 | 12854 | 9482 | 3372 | 26% | 0.74 : 0.26 |
| September | | | | | | |
| Oktober | 37 | | | | | |
| November | | | | | | |
| Desember | 42 | | | | | |

Tabel 4.2 Diskripsi 10 Dataset UCI

| Dataset | Atribut | Jumlah Data | <i>Imbalanced Ratio</i> |
|----------|---------|-------------|-------------------------|
| Abalone | 8 | 731 | 0.94 : 0.06 |
| Breast | 10 | 106 | 0.66 : 0.34 |
| Ecoli | 8 | 336 | 0.77 : 0.23 |
| Glass | 10 | 214 | 0.76 : 0.24 |
| Libra | 91 | 360 | 0.80 : 0.20 |
| OCR | 65 | 3823 | 0.90 : 0.10 |
| Robot | 25 | 5456 | 0.78 : 0.22 |
| Satimage | 37 | 6435 | 0.68 : 0.32 |
| Wine | 14 | 178 | 0.76 : 0.24 |
| Yeast | 9 | 1484 | 0.79 : 0.21 |

Dataset pengujian disusun ke dalam bentuk akumulasi bulanan (**Gambar 3.3**). Proses pencarian pola mahasiswa bermasalah dengan menggunakan klasifikasi data mining dilakukan terhadap data bulanan yang disusun terakumulasi dari satu bulan ke bulan-bulan berikutnya. Adanya perbedaan atribut bulan Agustus sampai dengan Desember dikarenakan ada pembagian data akademik. Pembagian 3 data berdasarkan bulan awal, bulan tengah semester dan akhir semester (**Gambar 4.1** dan **Lampiran 1**). Skenario tengah semester melengkapi skenario data akumulasi bulanan. Hasil nilai UTS dimasukkan ke dalam skenario bulanan akumulasi pada bulan Oktober, November, dan Desember (**Gambar 4.2**).

4.3 *Oversampling* MWMOTE

Oversampling MWMOTE memiliki tiga fase dalam menangani *imbalanced* dataset. Dalam penanganan *imbalanced* data akademik dan dataset UCI dilakukan iterasi sebanyak 15 kali untuk mengetahui data sintetik yang terbentuk memiliki hasil representatif (**Lampiran 2 dan 4**).

1. Fase pertama

Pada fase ini, dilakukan pemisahan antara dataset minoritas / S_{\min} (**Tabel 4.2**) dengan dataset mayoritas / S_{\max} (**Tabel 4.3**). Data minoritas dan mayoritas dipisahkan dengan adanya 2 label kelas yaitu lulus dan tidak lulus. Label kelas tidak lulus memiliki jumlah data yang lebih sedikit yang dianggap sebagai data minoritas dan sebaliknya untuk mahasiswa dengan label lulus sebagai data

mayoritas (**Lampiran 1**). Data minoritas dibagi menjadi tiga bagian dengan ketentuan berada pada data mayoritas, dekat dengan *borderline*, dan data minoritas yang berada pada *borderline*.

Tabel 4.3 Contoh Dataset Minoritas

| Index Data | Atribut 1 | Atribut 2 | Atribut 3 | Atribut 4 | ... | ... | Atribut 'n' |
|------------|-----------|-----------|-----------|-----------|-----|-----|-------------|
| 2 | 11.48 | 17.43 | 53.8 | 75.83 | ... | ... | 39.635 |
| 4 | 82.52 | 38.45 | 52.93 | 86.51 | ... | ... | 61.11 |
| 22 | 18.03 | 17.43 | 53.8 | 75.83 | ... | ... | 36.352 |
| 31 | 43.51 | 72.19 | 69.74 | 77.06 | ... | ... | 11.11 |
| 32 | 45.38 | 31.77 | 57.27 | 75.83 | ... | ... | 44.272 |
| 33 | 96.75 | 72.19 | 69.74 | 77.06 | ... | ... | 61.11 |
| 34 | 89.92 | 32.08 | 52.17 | 84.06 | ... | ... | 66.67 |
| 35 | 96.12 | 32.08 | 52.17 | 84.06 | ... | ... | 100 |
| 49 | 95.24 | 28.26 | 53.8 | 75.48 | ... | ... | 83.33 |
| 62 | 93.23 | 18.75 | 61.71 | 65.85 | ... | ... | 66.67 |
| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |

Pada pre-proses, data minoritas memiliki 3 kriteria, yaitu data minoritas yang berada dalam data mayoritas ($S_{\min f}$), data minoritas yang berada pada *borderline* (S_{bmaj}), dan data yang bersifat informatif (S_{imin}).

Tabel 4.4 Contoh Dataset Mayoritas

| Index Data | Atribut 1 | Atribut 2 | Atribut 3 | Atribut 4 | ... | ... | Atribut 'n' |
|------------|-----------|-----------|-----------|-----------|-----|-----|-------------|
| 0 | 94.41 | 53.42 | 62.91 | 78.28 | ... | ... | 100 |
| 1 | 98.59 | 51.79 | 62.8 | 78.28 | ... | ... | 100 |

| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |

2. Fase kedua pembobotan data minoritas

Pembobotan data minoritas digunakan dalam penentuan kandidat data sintetik (**Tabel 4.5**). Pembobotan memiliki 3 bagian :

- Pembobotan data minoritas yang mempunyai jarak terdekat dengan *borderline*.
- Kelompok data minoritas terdiri dari kelompok kecil.
- Kelompok data minoritas berjumlah banyak berada dalam data mayoritas.

Tabel 4.5 Contoh Pembobotan Dataset Minoritas

| No | Anggota 1 (Mayoritas) | Anggota 2 (Minoritas) | Hasil Pembobotan | No | Anggota 1 (Mayoritas) | Anggota 2 (Minoritas) | Hasil Pembobotan |
|-----|--------------------------|--------------------------|---------------------|-----|--------------------------|--------------------------|---------------------|
| 1 | 25 | 16 | 0.001 | 16 | 12 | 21 | 0.11087 |
| 2 | 27 | 21 | 0.05895 | 17 | 25 | 29 | 0.01656 |
| 3 | 13 | 4 | 0.00934 | 18 | 27 | 19 | 0.0014 |
| 4 | 18 | 4 | 0.00742 | 19 | 15 | 4 | 0.00924 |
| 5 | 3 | 21 | 0.07148 | 20 | 9 | 16 | 0.00095 |
| 6 | 9 | 29 | 0.01404 | 21 | 15 | 29 | 0.01109 |
| 7 | 18 | 19 | 0.00149 | 22 | 27 | 4 | 0.00844 |
| 8 | 9 | 4 | 0.00785 | 23 | 3 | 19 | 0.0013 |
| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |
| ... | ... | ... | ... | ... | ... | ... | ... |

3. Fase ketiga proses *clustering*

MWMOTE menggunakan proses *clustering* untuk membentuk kumpulan data minoritas dalam satu kelompok yang memiliki kemiripan data. Metode *cluster* yang digunakan adalah sebagai berikut :

- Average linkage*, menentukan anggota *cluster* dengan menggunakan jarak antar data berdasarkan rata-rata (**Tabel 4.6**).
- Complete linkage clustering*, menentukan anggota *cluster* berdasarkan jarak terjauh antara data (**Tabel 4.7**).
- Penentuan anggota cluster berdasarkan jarak terdekat antar data disebut *single linkage* (**Tabel 4.8**).

Tabel 4.6 Proses *Clustering* dengan *Average Linkage*

| Proses | Hasil |
|-----------------|--|
| Cluster Awal | 0: [2], 1: [4], 2: [22], 3: [31], 4: [32], 5: [33], 6: [34], 7: [35], 8: [49], 9: [62], 10: [77], 11: [81], 12: [82], 13: [83], 14: [84], 15: [85], 16: [86], 17: [87], 18: [91], 19: [104], 20: [112], 21: [113], 22: [114], 23: [115], 24: [116], 25: [117], 26: [118], ..., ..., ..., ... |

Clustering pada MWMOTE menggunakan *bottom-up* yang dimulai dari seluruh data minoritas sebagai *cluster*. Selanjutnya menggabungkan menjadi satu *cluster* besar dengan menentukan *threshold* (T_h) untuk menjadikan batas ambang jumlah *cluster* yang terbentuk. Penggunaan *threshold* bertujuan menghasilkan sejumlah *cluster* yang berbeda untuk jenis data yang sama, di mana satu-satunya perbedaan adalah dimensi fitur. *Threshold* yang konstan akan mendapatkan fakta bahwa dalam beberapa dataset relatif jarang (jarak rata-rata antara sampel yang besar), sementara di dataset lainnya relatif padat (rata-rata dari sampel yang berbeda-beda). *Threshold* bergantung pada data dan harus dihitung menggunakan beberapa heuristik dari ukuran jarak antara data. Nilai *threshold* didapat dari jarak rata-rata minimum (S_{minf}) dari seluruh data (d_{avg}) dan nilai konstanta (C_p). C_p merupakan nilai konstan yang diberikan untuk menentukan jumlah *cluster* yang terbentuk. Semakin tinggi nilai C_p maka penurunan terhadap jumlah *cluster*, akan tetapi bertambah jumlah anggota *cluster* dan skenario sebaliknya akan terjadi jika nilai C_p .

$$d_{avg} = \frac{1}{|S_{minf}|} \sum_{x \in S_{minf}} \min_{y \neq x, y \in S_{minf}} \{dist(x, y)\} \quad (4.1)$$

$$T_h = d_{avg} \times C_p \quad (4.2)$$

Tabel 4.9 merupakan kandidat pembuatan data sintetik berdasarkan *cluster* dan pembobotan (S_w) pada tahap kedua MWMOTE secara random dalam satu *cluster*. Kandidat data sintetik memiliki bobot tertentu untuk menyatakan data sintetik akan dibuat. Data sintetik terbentuk dari gabungan anggota *cluster* dari data minoritas (**Tabel 4.10 dan 4.11**). Jumlah data sintetik yang terbentuk merupakan jumlah selisih antara data mayoritas dengan data minoritas. Hasil *oversampling* memiliki rasio yang seimbang dengan perbandingan data mayoritas dengan data minoritas serta data sintetik.

Tabel 4.9 Data Sintetik berdasarkan Pembobotan (S_w)

| No. | Kandidat Cluster | Anggota Cluster | Pemilihan Bobot (S_w) |
|-----|------------------|-----------------|---------------------------|
| 1 | 133 | 1 | 0.010421395329481827 |

4.4 Evaluasi Ratio MWMOTE

Berdasarkan data akademik, terdapat 5 data yang terdiri dari bulan Agustus, September, Oktober, November, dan Desember. Data akademik memiliki rasio yang sama dari ke 5 data tersebut sebesar 0.74 : 0.26, dimana 0.74 merupakan data mayoritas dan 0.26 adalah data minoritas (**Tabel 4.1**). Data akademik yang memiliki karakteristik data yang berbeda antara Agustus – Desember, sehingga data mayoritas dan minoritas memiliki hasil evaluasi berbeda. Data UCI yang digunakan adalah Abalone, Breast, Ecoli, Glass, Libra, OCR, Robot, Satimage, Wine dan Yeast dimana data UCI tersebut memiliki jumlah rasio yang tidak seimbang antara kelas mayoritas dan minoritas (**Tabel 4.2**). Untuk data UCI terlihat berbeda mulai dari jumlah atribut, jumlah data, dan *imbalanced Ratio* akan menyebabkan permasalahan dalam *imbalanced*. Hasil pengujian metode klasifikasi di dataset yang tidak seimbang biasanya memiliki ciri khas berupa nilai *instance* yang terklasifikasi (*misclassification cost*) di kelas minoritas lebih tinggi dibandingkan dengan *misclassification cost* di kelas mayoritas. Diperlukan penanganan data *imbalanced* untuk mendapatkan hasil klasifikasi yang representatif dan akurat.

MWMOTE dapat digunakan dalam penanganan data *imbalanced* dengan cara pembuatan data sintetik. Data sintetik terbentuk dari proses oversampling berdasarkan pembobotan dan pengklasteran dari data minoritas. Sehingga didapat data akademik dan UCI yang memiliki rasio seimbang berdasarkan jumlah data (**Tabel 4.12** dan **Tabel 4.13**).

Selisih antara data mayoritas dengan data minoritas dijadikan acuan untuk pembuatan data sintetik.

Tabel 4.12 Rasio Jumlah Data Akademik Tanpa MWMOTE dan Dengan MWMOTE

| <i>Imbalanced data</i> | <i>Imbalanced ratio Tanpa MWMOTE</i> | | <i>Imbalanced ratio dengan MWMOTE</i> | | |
|-------------------------|--------------------------------------|-----------|---------------------------------------|-----------|----------|
| | Mayoritas | Minoritas | Mayoritas | Minoritas | Sintetik |

| Data Akademik Oktober | | | | | |
| Data Akademik November | | | | | |
| Data Akademik Desember | | | | | |

Tabel 4.13 Rasio Jumlah Data UCI Tanpa MWMOTE dan Dengan MWMOTE

| <i>Imbalanced data</i> | <i>Imbalanced ratio Tanpa MWMOTE</i> | | <i>Imbalanced ratio dengan MWMOTE</i> | | |
|------------------------|--------------------------------------|-----------|---------------------------------------|-----------|----------|
| | Mayoritas | Minoritas | Mayoritas | Minoritas | Sintetik |
| Data UCI Abalone | 0.94 | 0.06 | 0.94 | 0.06 | 0.88 |
| Data UCI Breast | 0.66 | 0.34 | 0.66 | 0.34 | 0.32 |
| Data UCI Ecoli | 0.77 | 0.23 | 0.77 | 0.23 | 0.54 |
| Data UCI Glass | 0.76 | 0.24 | 0.76 | 0.24 | 0.52 |
| Data UCI Libra | 0.80 | 0.20 | 0.80 | 0.20 | 0.60 |
| Data UCI OCR | 0.90 | 0.10 | 0.90 | 0.10 | 0.80 |
| Data UCI Robot | 0.78 | 0.22 | 0.78 | 0.22 | 0.56 |
| Data UCI Satimage | 0.68 | 0.32 | 0.68 | 0.32 | 0.36 |
| Data UCI Wine | 0.76 | 0.24 | 0.76 | 0.24 | 0.52 |
| Data UCI Yeast | 0.79 | 0.21 | 0.79 | 0.21 | 0.58 |

Data yang sudah seimbang akan diproses dengan menggunakan *classifier dicission tree* (J48). Untuk mengetahui algoritma MWMOTE dapat menangani permasalahan *imbalanced* pada data akademik dan data UCI.

4.5 Evaluasi dan Pengujian

Evaluasi dan pengujian metode pada penelitian ini digunakan untuk mengetahui apakah metode yang diusulan tersebut dapat menyelesaikan permasalahan *imbalanced* pada kasus data akademik Univeristas XZY angkatan 2014 dan 2015 dan dataset UCI. Evaluasi terbagi menjadi 2 macam yaitu evaluasi *cluster* dan evaluasi algoritma MWMOTE. Pada penelitian ini didapatkan hasil evaluasi yang berbeda antara *cluster* dan metode dengan *classifier*.

4.5.1 Evaluasi Cluster

Evaluasi *cluster* dilakukan dengan *Cophenetic Correlation Coefficient* (CCC). Berdasarkan hasil uji coba, digunakan metode *hierarchical clustering* untuk mengetahui performa algoritma MWMOTE guna mendapatkan data sintetik yang representative berdasarkan hasil akurasi dari klasifikasi *decision tree*. Data sintetik terbentuk dari data minoritas dan data pada *cluster* (kemiripan data dalam satu *cluster*). **Tabel 4.14** menunjukkan *average linkage clustering* menghasilkan nilai *Cophenetic Correlation Coefficient* yang lebih besar dibandingkan dengan *complete* dan *single linkage*.

Hasil evaluasi *cluster* dilakukan berdasarkan data minoritas yang memiliki kesamaan antar anggota *cluster* dengan cara menganalisis seluruh data. Penentuan CCC antar pasangan data *cluster* dilakukan melalui pengukuran antar anggota *cluster*. Nilai CCC terbaik pada data akademik adalah 0.94350 dengan *average*, 0.90986 dengan *complete* dan 0.89377 dengan *single* di bulan agustus. Nilai CCC dikatakan baik apabila mendekati 1.

Tabel 4.14 Hasil Evaluasi *Cluster* dengan CCC

| | AGUSTUS | SEPTEMBER | OKTOBER | NOVEMBER | DESEMBER |
|-----------------|----------------|----------------|----------------|----------------|----------------|
| <i>Average</i> | 0.94350 | 0.83730 | 0.84525 | 0.86386 | 0.82656 |
| <i>Complete</i> | 0.90986 | 0.56457 | 0.72691 | 0.62255 | 0.69469 |
| <i>Single</i> | 0.89377 | 0.65250 | 0.75661 | 0.80126 | 0.67243 |

Evaluasi metode *cluster* dilakukan lebih lanjut dengan uji coba menggunakan UCI *Machine Learning Repository* dataset. UCI *Machine Learning Repository* adalah dataset umum yang banyak dipakai para peneliti untuk mengevaluasi metode yang diusulkan. Pada penelitian ini, dataset UCI digunakan untuk validasi hasil analisis *cluster*. Abalone, Breast, Ecoli, Glass, Libra, OCR, Robot, Satimage, Wine dan Yeast merupakan dataset UCI yang dipakai untuk mengetahui kinerja *cluster*. **Gambar 4.4** menunjukkan nilai tertinggi CCC terdapat pada *average linkage*. Hasil evaluasi data dengan menggunakan dataset UCI menunjukkan bahwa *average linkage* memiliki nilai tertinggi dari *complete* dan *single linkage* pada data minoritas. Guna mengetahui kesamaan hasil data sintetik yang terbentuk dari data minoritas hasil CCC, dilakukan evaluasi *classification* dengan J48 pada data *imbalanced*.

Gambar 4.4 Hasil evaluasi CCC dengan Dataset UCI

4.5.2 Evaluasi Metode

Evaluasi metode yang diusulkan menggunakan *decision tree classification* (J48) untuk data akademik Universitas XYZ angkatan 2014 dan 2015. Pengujian evaluasi meliputi beberapa kriteria, yaitu nilai *precision*, *recall*, *F-Measure*, dan *accuracy*. **Tabel 4.12** menyajikan data akademik dengan rasio yang tidak seimbang. Dilakukan evaluasi untuk mengetahui perbaik dari data yang tidak seimbang. Berdasarkan pengujian menunjukkan penggunaan *single linkage* pada algoritma MWMOTE memiliki nilai paling tinggi dibandingkan *average* dan *complete linkage*. Berdasarkan data akademik per bulan, evaluasi *imbalanced* dataset akademik bulan Desember dengan algoritma MWMOTE menghasilkan nilai tertinggi berdasarkan seluruh kriteria dibandingkan dengan bulan yang lainnya (menggunakan *average*, *complete*, dan *single linkage*) (**Tabel 4.15 - 4.17**).

Tabel 4.15 Data Akademik sebelum dilakukan *Oversampling*

| | <i>Precision</i> | <i>Recall</i> | <i>F-measure</i> | <i>Accuracy</i> |
|-----------|------------------|---------------|------------------|-----------------|
| Desember | 72.00% | 70.70% | 72.03% | 72.00% |
| November | 71.20% | 70.90% | 71.21% | 71.20% |
| Oktober | 71.10% | 70.40% | 71.13% | 71.10% |
| September | 70.80% | 70.00% | 70.83% | 70.80% |
| Agustus | 70.00% | 70.20% | 70.10% | 70.16% |

Tabel 4.16 Hasil Evaluasi *Imbalanced* dataset dengan *Average Linkage* dan MWMOTE

| | <i>Precision</i> | <i>Recall</i> | <i>F-measure</i> | <i>Accuracy</i> |
|-----------|------------------|---------------|------------------|-----------------|
| Desember | 88.26% | 87.94% | 88.08% | 87.95% |
| November | 79.39% | 78.14% | 78.61% | 78.14% |
| Oktober | 78.63% | 77.53% | 77.98% | 77.53% |
| September | 73.25% | 72.89% | 73.03% | 72.88% |
| Agustus | 70.37% | 71.93% | 70.91% | 71.93% |

Tabel 4.17 Hasil Evaluasi *Imbalanced* dataset dengan *Complete Linkage* dan MWMOTE

| | <i>Precision</i> | <i>Recall</i> | <i>F-measure</i> | <i>Accuracy</i> |

| Agustus | 70.17% | 71.49% | 70.70% | 71.50% |

Performa metode yang diusulkan divalidasi dengan data UCI *Machine Learning Repository* (Abalone, Breast, Ecoli, Glass, Libra, OCR, Robot, Satimage, Wine dan Yeast). **Gambar 4.5** adalah hasil evaluasi akurasi pada 10 dataset UCI. Evaluasi dari dataset UCI didapat hasil yang berbeda dikarenakan setiap dataset memiliki karakteristik berbeda. Pada *complete linkage* memiliki hasil evaluasi akurasi tertinggi dari 7 dataset yaitu abalone, breast, glass, ocr, satimage, wine, dan yeast. Hasil *average linkage* pada data UCI memiliki rata-rata 96.83% dari seluruh dataset. Akurasi rata-rata dari *single linkage* untuk seluruh data UCI adalah 96.49%.

Gambar 4.5 Hasil Evaluasi Akurasi pada Dataset UCI

4.6 Uji Statistik

Uji statistika menjadi uji pembandingan untuk menentukan nilai perbedaan signifikan antar *average*, *complete*, dan *single linkage* pada *oversampling* MWMOTE. Pada penelitian ini, pengujian statistika dilakukan pada salah satu kriteria yaitu *accuracy*. Metode *cluster* yang diusulkan dapat memperbaiki hasil evaluasi pada algoritma MWMOTE merupakan H_0 . Jika tidak perbedaan signifikan pada uji statistik dinyatakan H_1 . Hipotesis (H_0 dan H_1) dapat dinyatakan berdasarkan nilai *alpha* (*p-value/sig*). Jika H_0 diterima nilai *alpha* < 0.05 dan sebaliknya H_0 ditolak jika nilai *alpha* (*p-value/sig*) > 0.05 . Uji statistika diawali dengan uji normalitas dan homogenitas sebagai syarat pengujian *One Way ANOVA* (Sopiyudin, 2001)(**Lampiran 2**).

Data dinyatakan normal dan homogen apabila memiliki nilai *alpha* (*p-value/sig*) > 0.05 . Hasil *One Way ANOVA* dapat diuji lanjut dengan *Duncan* apabila memiliki nilai *alpha* (*p-value/sig*) < 0.05 . Berdasarkan hasil *One Way ANOVA*, metode *average*, *complete*, dan *single linkage* tidak signifikan terhadap peningkatan nilai *accuracy* pada algoritma *oversampling* MWMOTE. Hasil tersebut didapatkan berdasarkan keseluruhan data akademik pada bulan Agustus (**Tabel 4.19**) dengan nilai *p-value* 0.178, September (**Tabel 4.20**) dengan nilai *p-value* 0.211, Oktober (**Tabel 4.21**) dengan nilai *p-value* 0.484, November (**Tabel 4.22**) dengan nilai *p-value* 0.946, dan Desember (**Tabel 4.23**) dengan nilai *p-value* 0.749.

Pada data UCI dengan pengujian *One Way ANOVA* didapat hasil bahwa Abalone, Robot, Satimage memiliki nilai $\text{sig}/\alpha < 0.05$. Pada pengujian lanjut dapat diteruskan dengan uji lanjut Duncan berdasarkan nilai sig/α untuk menyatakan perbedaan signifikan terjadi pada *single linkage* terhadap average dan *complete linkage* (**Lampiran 5**). Breast, Ecoli, Glass, Libra, OCR, Wine dan Yeast tidak memiliki beda signifikan berdasarkan uji ANOVA dengan $\text{sig}/\alpha > 0.05$ (**Lampiran 5**),

Tabel 4.19 Hasil Uji *One Way ANOVA* Bulan Agustus dengan Nilai Sig > 0.05

| | <i>Sum of Squares</i> | df | <i>Mean Square</i> | F | Sig. |

BAB 5

KESIMPULAN DAN SARAN

5.1 Kesimpulan

Berdasarkan hasil uji coba dari metode usulan memberikan beberapa kesimpulan yaitu :

1. Metode *oversampling* MWMOTE digunakan untuk menangani permasalahan *imbalanced* data akademik Universitas XYZ angkatan 2014 dan 2015 dengan nilai akurasi 87.95% pada *average*, 87.88% pada *complete* dan *single* sebesar 87.81%. Data UCI dalam penelitian diperoleh hasil evaluasi rata-rata akurasi 96.83% untuk *average*, 97.50% pada *complete*, dan 96.49% *single*.
2. Algoritma MWMOTE terbukti memperbaiki akurasi rata-rata sebesar 6.61% dari seluruh bulan pada data akademik dan data UCI sebesar 1.2% dibandingkan tanpa penanganan *imbalanced*.
3. *Average*, *complete* dan *single* dapat digunakan pada MWMOTE dengan tingkat akurasi yang tidak berbeda signifikan berdasarkan uji statistic *One Way ANOVA* dengan nilai *sign / alpha* > 0.005
4. Evaluasi *cluster* terbaik didapat pada metoda *average linkage* dengan nilai *cophenetic* sebesar 0.8632 pada data akademik dan 0.78747 pada data UCI.

5.2 Saran

Berdasarkan hasil yang diperoleh pada penelitian ini, perlu dilakukan pengkajian ulang dan penggunaan kombinasi metode dalam memperbaiki algoritma MWMOTE sehingga didapatkan nilai yang sama pada evaluasi *cluster* ataupun evaluasi metode *oversampling*.

Means for groups in homogeneous subsets are displayed.

a. Uses Harmonic Mean Sample Size = 5.000.

BIODATA PENULIS

Meida Cahyo Untoro, lahir di Kediri 18 Mei 1989. Penulis merupakan anak kedua dari pasangan Maryanto dan Karsini. Penulis juga merupakan penikmat musik, gemar berolahraga, keterkaitan dengan elektro, dan otomotif kendaraan (modifikasi dan bengkel).

Penulis menempuh pendidikan formal di SDN Sambirobyong II (1995 – 2001), SMP Negeri 1 Pagu (2001 – 2004), SMA Negeri 1 Papar (2004 – 2007), S-1 Sistem Komputer STIKOM BALI dengan bidang minat *User Interface* (2009-2012). Pada tahun 2016 penulis melanjutkan pendidikan Magister di Institut Teknologi Sepuluh Nopember dengan jurusan Teknik Informatika. Saat menempuh pendidikan S2 penulis sebagai Tenaga Pendidik di Institut Ilmu Kesehatan Bhakti Wiyata dengan Program Studi Rekam Medis Informasi Kesehatan.

Penulis menaruh minat pada topik Dasar dan Terapan Komputasi (DTK). Penulis dapat dihubungi via e-mail dengan alamat meidacahyountoro@gmail.com
